# Welcome to the 23rd International Conference on Optical Communications and Networks

It is a great pleasure to invite you to participate in the 23<sup>rd</sup> International Conference on Optical Communications and Networks (ICOCON2025) and share the latest news in communications and photonics science, technology and innovations from leading universities, research laboratories and companies throughout the world. ICOCN has been held annually tracing back to 2002. It is now one of the largest international conferences on optical communications, photonics and relevant technologies.

ICOCON2025 features plenary, keynote, invited, and contributed talks by leading international researchers from academia and industry. This year's conference will address the following topics: Optical fibers and fiber-based devices; Optical transmission systems, subsystems and technologies; Networks architectures, management and applications; Optoelectronic integration and devices; Optical signal processing and microwave photonics; Optical measurements and imaging; Ultrafast photonics and nonlinear optics; Free space communications; Optoelectronics based on organic and nanostructured materials; Machine learning for photonics and communications; 2D-materials based photonics; Optical biosensors, imaging and theranostics.

ICOCON2025's comprehensive, high-quality program offers the perfect platform to discover emerging research trends and connect with the leaders driving these innovations. We have over 680 presentations scheduled, including 4 plenary speeches and 300 keynote & invited talks given by many of the world's most prominent researchers from academia and industry. We thank all the contributors and authors for making ICOCON2025 a truly unique, outstanding global event.

There will be one plenary session, 70 regular technical sessions, and two post-deadline paper se-

ssions. The plenary session is scheduled on the morning of Tuesday, 29th July. Four distinguished speakers will give presentations: Prof. Xiaomin Ren from Beijing University of Posts and Telecommunications will present on Novel understanding of micro-particles: the rest-energy excluded frequency-determination energy and the potential-energy-affected wavelength. Prof. Libo Yuan from Guilin University of Electronic Science and Technology will talk on entitled by Remarks on In-fiber Integrated Optic Devices and Components. Dr. Chongjin Xie from PhotonicX AI will report on Optical Interconnects for AI Datacenters and Prof. Bai-ou Guan from Jinan University on Photoacoustic imaging empowered by fiber-optic ultrasonic sensors.

Young Scientist Awards will be given to 2 young researchers with the age no more than 40 by the conference date who make outstanding contributions and present on our conference. In addition, 10 Best Student Paper Awards and 10 Best Poster Awards will be selected by the Technical Committee or expert panel during the conference. All these awards will be presented during the conference banquet on the evening of Wednesday, 30 July. In addition to the technical program, there will be impressive exhibitions from the relevant industries, publishers and professional organizations.

We have also prepared a rich social program to facilitate meeting and networking with colleagues from so many universities and cities. On the evening of Wednesday, 30 July, the Banquet and Awards Ceremony will be held for all conference registrants. Lucky-draw will be carried out for those who help us select the Best Poster Award by submitting the award ticket.

It is an enormous task to organize a conference and it is impossible to succeed without the dedicated efforts of many supporters and volunteers. We are

indebted to the entire Technical Program Committee and the Subcommittee Chairs who have worked persistently throughout the whole year to invite speakers, solicit and review papers, organize the technical sessions which results in the excellent technical program. We thank the staff and volunteers from Hunan Univ., Guangdong Univ. of Technology and China Jiliang Univ. We also thank the IEEE Photonics Society, IEEE Guangzhou Section, IEEE Photonics Society Guangdong Chapter for sponsoring the event.

Sincerely,

**Venue:** *Sunshine Hall (2F), Sunshine Hotel*

**Novel Understanding of Micro-Particles: The Rest-Energy-Excluded Frequency-Determination Energy and the Potential-Energy-Affected Wavelength**

09:00-09:45, Tuesday, 29 July

**Prof. Xiaomin Ren**

*Beijing Univ. of Posts & Tel., China*

**Biography:** Xiaomin Ren, IET Fellow, COS Fellow, CIE Fellow, Professor of Beijing University of Posts and Telecommunications (BUPT), Chief Scientist of the State Key Laboratory of Information Photonics and Optical Communications of China (SKL-IPOC), Vice President of Chinese Optical Society (COS). He had also been a Vice President of BUPT (1996-2017), the Director of SKL-IPOC (2003-2023) and the Chairman of ACP Conference Steering Committee (2015-2023). He worked as a Senior Visiting Scholar in Centro Studi E Laboratori Telecomunicazioni, Turin, Italy, and then as a Visiting Senior Research Fellow in the Microelectronics Research Center, University of Texas at Austin, USA, during 1994 to 1996. He had been awarded with the title of Outstanding Young Scientist of China by NNSFC (1996). He had been a Vice Head of the Optoelectro-

nic Expert Group under the National 863 Program for many early years and the Chief Scientist of the relevant research projects of the National 973 Program twice from 2003 to 2014. He has worked on information optoelectronic technologies and nanoheterostructure physics, mainly including semiconductor lasers, photodetectors, silicon-based III-V optoelectronic integration, novel low-dimensional heterostructures and devices, photonic crystal fibers, etc. He has also worked on fundamental physics since 2012 and proposed the concept of energy-level divergence, the theory of fractional (or continuous real-number) dimensionality electron-states architecture in semiconductors, the Bivergentum Theory going to unify the classical and quantum mechanics together and extend the Einstein's high speed special theory of relativity to a quite new one, i.e. the full-velocity-scope special theory of relativity. He advocates that quantum mechanics must go back to Logicism (in contrast with Instrumentalism) and believes that there does exist an amazing super-low speed 'world'.

# Explanation of Session Codes

The first letter of the code designates the day of the week (Tu = Tuesday, W = Wednesday, Th = Thursday). The second element indicates the session series in that day (for instance, 1 would denote the first parallel session in that day). The third element continues alphabetically through a series of parallel sessions. The lettering then restarts with each new series. The number on the end of the code (separated from the session code with a period) signals the position of the talk within the session (first, second, third, etc.). For example, a presentation coded Tu1A.1 indicates that this paper is being presented on Tuesday (Tu) in the first series of sessions (1), and is the first parallel session (A) in that series and the first paper (1) presented in that session.

**Novel Understanding of Micro-Particles: The Rest-Energy-Excluded Frequency-Determination Energy and the Potential-Energy-Affected Wavelength**, Xiaomin Ren; *Beijing University of Posts and Telecommunications, China*. Both electronics and optoelectronics are essentially based on de Broglie wave-particle duality which has played its role as the micro-particle fundamentals including the relation between particle energy and wave frequency and that between particle momentum and wavelength. However, the frequency-determination energy in the first relation has usually been misunderstood as the rest-energy included total particle energy and the wavelength in the second relation has been mistaken as a quantity only related to the momentum. Here presented are the modified ones featuring the rest-energy excluded frequency-determination energy and the potential-energy-affected wavelength (an effective momentum  $p_{\text{eff}} = (1 + Q_u U/E_k)p$  in the first order approximation of weak potential-energy is introduced) as well as the consequentially re-established Schrödinger equation and Dirac equation written respectively as follows:

$$i\hbar \frac{\partial \Psi}{\partial t} = -\frac{\hbar^2}{2\mu} \nabla^2 \Psi + (3 - 2Q_u)U\Psi$$

$$i\hbar \frac{\partial \Psi}{\partial t} - \frac{\hbar^2}{2\mu c^2} \frac{\partial^2 \Psi}{\partial t^2} = -\frac{\hbar^2}{2\mu} \nabla^2 \Psi + (3 - 2Q_u)U\Psi$$

For the former one, it can be found that when  $Q_u = 1$  and thus  $3 - 2Q_u = 1$ , it is just the Schrödinger equation that we are familiar with. It means that, actually, Schrödinger equation can be considered as a valid one only under the above-mentioned first-order approximation and the assumption of  $Q_u = 1$ .

For the latter one, it can be found that in the case of free space with  $U = 0$ , the re-established Dirac equation becomes

$$i\hbar \frac{\partial \Psi}{\partial t} - \frac{\hbar^2}{2\mu c^2} \frac{\partial^2 \Psi}{\partial t^2} = -\frac{\hbar^2}{2\mu} \nabla^2 \Psi$$

which is much simpler and even more elegant than the corresponding currently-recognized Dirac equation. Furthermore, it can be proved that the re-established Dirac equation can degenerate into the re-established or even the original Schrödinger ones when the particle velocity comes into the non-relativistic regime.

These modifications and re-establishments might lead to fascinate stories of the quantum-mechanics theory and various relevant technologies, especially in the area of electronics and optoelectronics.

**Remarks on In-fiber Integrated Optic Devices and Components**, Libo Yuan; *Guilin University of Electronic Science and Technology, China*. This report focuses on the integration of devices or components using quartz fiber as the substrate material, and discusses how to miniaturize and integrate various optical device or elements into a single fiber. The construction of functional optical devices, or the realization of optical component integration on the fiber through the combination of several single-function optical devices are systematically explored. The primary concepts and key technologies for the integration of optical devices and components in optical fibers are systematically summarized. The main functionalities and applications of such integrated devices and components in optical fiber communication and sensing are comprehensively reviewed. Finally, the potential application prospects of this technique in the field of minimally invasive interventional medicine in the future are elaborated.

Since the advent of ChatGPT, generative AI has attracted lots of attention, not only from academia and industries, but from general public as well. AI computing has become the new growth engine for the IT industry and is changing the landscape of computing. Datacenters are shifting their focus from general computing to AI computing. With massive data and various parallelisms used in AI computing, huge amount of interconnects at various levels are required for AI computing clusters. This talk focuses on optical interconnects for AI computing clusters in cloud datacenters, their requirements, current status and future challenges. Various technologies are discussed.

Tu1A.4 • 11:15 **Plenary**

**Photoacoustic imaging empowered by fiber-optic ultrasonic sensors**, Bai-ou Guan; *Jinan University, China*. Photoacoustic imaging as a hybrid imaging technology that integrates optical excitation and acoustic detection can not only provide anatomical information of biological tissues, but also reflect functional information such as oxygen saturation and metabolism rate. Conventional piezoelectric sensors for the detection of photoacoustic signals confront tradeoff between the sensitivity and footprint size, limiting the capability and flexibility for high-performance system design. In contrast, fiber-optic ultrasonic sensors feature size-independent sensitivity, small size, high sensitivity, and large working bandwidth, and therefore open up new path for developing miniaturized and wearable photoacoustic imaging systems. This talk will introduce our recent progress in photoacoustic imaging technology based on fiber-optic ultrasonic sensors. The fiber laser ultrasonic sensor technology with high sensitivity and strong anti-interference capability is introduced at first, which is followed by photoacoustic endoscopy, small-animal head-mounted photoacoustic microscopy, and the deep-penetration photoacoustic computed tomography.
